Doomsday Engine - Bug #2353

Bugs in Doomsday Script parsing and execution

2019-11-25 11:11 - skyjake

Status:	Closed		**Start date:**	2019-11-25
Priority:	Normal		**% Done:**	100%
Assignee:	skyjake			
Category:	Defect			
Target version:	2.2 (2019)			

Description

- "doomsdayscript" tool can't import modules from the same directory
- parser fails when encountering a single-line compound at end of file
- slice operator doesn't omit the last element when range begins beyond the end of the array
- typo in exception error message when thrown from script ("in thrown in script")
- identifier lookup operator -> doesn't allow nested identifiers (a->b->c)
- assertion failure when trying to pass an owned reference to record as argument
- Record() does not accept a dictionary as argument to construct a record
- trying to print a null reference aborts the script (just print "null" instead)
- each function remembers and accesses its own module's global namespace
- "export" keyword is useless and should be removed
