| Description when the toggle command is used on cvars such as rend-camera-fov which obviously shouldnt be togglable it applies anyway, setting it to 0, causing a HOM on the whole screen. Better behavior would be: >toggle rend-camera-fov rend-camera-fov is not boolean alternatavely, the two settings, (or possibly more, to cycle through) could be defined, so; bind z {toggle rend-camera-fov {45,110}} would make the key z a toggle for zoom.
