Description ltc_plane_move: If lpref_none is used in the lp11 or lp13 slots of a line of this class (change sector type on start/finish) then the type should be set to 0 (removed). This is for planned Boom compatibility. Labels: XG

Found a work around so this is redundant.

Not very important as the data component can be specified using lp12/14 set to 0 and use lpref_special to treat as sector type ID.

However this would simplify things when comparing the bit filed mask used in the sector type field (range > 8192).
