This requires some investigation. I suspect the crash is caused by a race condition in Doomsday's file indexing.

are tons of mod support doomsday now like zblood, terminator future war, aliens eradication tc, halo in doom.pk3, wolfenstein 3d, duke 3d an many otehrs?

If you're asking if 2.3 improves mod support with regard to mods made for other engines, the answer is no...

race condition?

whats that?

That's a programming term for a problem where multiple threads are handling the same data with a random outcome, so one possible result is a crash because the data gets garbled.

ok so i manage to get the program finally working by using the sourceforge version. but i still get issues when loading mods or wads like REKKR for instant. no episodes or skill is listed when creating a custom profile.
