Target version: 1.8.6	
Description My PC completely hangs and reboots when I play level 1 of DOOM. My PC: P4C 2.6 overclocked to 3.1 GHz. ATI Radeon 9700 1 GB of DDR memory (4 banks Corsair XMS3000) Philips Acoustic Edge soundcard Thanks for the effort, I do hope I'll be able to play Doom on my PC again :) I spent many many nights on it 10 yrs ago. Labels: jDoom

We'll need so more info before we can diagnose the problem.
Can you please post the contents of your Doomsday.out file next time it crashes.

Also, what were you doing at the time of the crash? Any other programs running? What OS are you running?

Rejecting due to insufficient information to determine if it is deng, or the overclocked system at fault. Please re-open if you can reproduce this with the 1.9.0beta4 release **without** overclocking your system.
